Antibiotic recognition and efflux by MexY in bacterial pathogen *Pseudomonas Aeruginosa*

By using a multi-disciplinary approach (i.e., biochemistry, structural biology, and microbiology), we can tackle the threat of antibiotic resistance and identify targets for novel antibacterial therapeutics.

Antibiotic resistance : A global health crisis

Antibiotic resistance : A global health crisis

Mechanisms of Resistance

Bacterial Efflux Pumps Play Role in Resistance Development and Are Targets for Therapeutics

Approaches To Understanding Antibiotic Recognition By Efflux Transporter, MexY

- Understand mechanisms for pumps across multiple bacterial species
- Design of novel efflux pump inhibitors and/or
- Redesign of current therapeutics to evade efflux

This work is supported by a National Institutes of Health (NIH)/ National Institute of General Medical Sciences (NIGMS) NRSA pre-doctoral fellowship (to LGK; **F31-GM143891**), a student traineeship from the Cystic Fibrosis Foundation (to LGK; **Kavana21HO**), and the Emory University Research Council (to GLC). LGK also gratefully acknowledges support from the Atlanta Chapter of ARCS Foundation and from Center for CF and Airway Disease Research CF Scholars program.
